

Module response split by supplement arm

The main figure pools creatine and placebo into one CR group; 6 paired subjects per arm.
No fry contrast reaches FDR < 0.05. NES boxes mark the competitive test, which large modules pass easily and which does not on its own show an arm effect.

Eigengene by supplement arm

mean ± SE; both arms share the control point

CR-only 2x2 contrasts

creatine vs placebo, 6 paired subjects per arm
